Flow

A simpler interface for complex work

Flow is building a floating interface that coordinates repeatable AI and software workflows for small teams.

Founder

Seth Pina | Pre-revenue | Product in development

The problem

Work moves across separate tools

A small content team carries briefs, scripts, assets and revision requests between systems by hand. Context gets rebuilt and ownership becomes unclear.

Initial customer hypothesis

Small agencies handling repeated client content revisions. Customer demand remains to be validated.

The product direction

One intent and status interface

A user requests an outcome, reviews proposed actions and sees the state of the work. The underlying workflow handles approved steps and exceptions.

First proposed package

Client Revision Coordinator: attach a revision to the right deliverable, assign an authorized owner and track approval with evidence.

Current state

Foundation exists

The floating interface and creative production foundation exist in the codebase. Prior audits found deployment and integration gaps.

Milestone still ahead

Complete and verify one connected customer workflow in real accounts. There are no established paying customers or proven usage metrics for Flow.

Validation plan

Start with one agency process

Interview agencies, confirm the actual revision workflow and supported tools, then deliver a controlled pilot with explicit permissions.

Measure what matters

Record successful runs, exceptions, setup time, support effort, provider costs, repeat use and willingness to pay.

Angel investment discussion

Use of capital

Complete the shared workflow runtime and first adapters; verify a customer-account pilot; document reliability and cost before broader expansion.

Financing status

Flow is seeking an early angel partner. Round size, terms and valuation are not yet set. Contact: sethpina11@gmail.com
